

Logins aur URLs — OyeBazar

Kaun kahan se andar aata hai, aur kis ke paas kitna ikhtiyar hai.

Production par domain `oyebazar.com` hai; neech ke raaste wahan bhi wohi hain
(`http://localhost:3000` ki jagah `https://oyebazar.com`).

Poore system mein koi password nahi hai. Har login WhatsApp OTP se hota hai: number daalen, 6 hindson ka code aata hai, andar. Wajah **ARCHITECTURE.md** mein hai — phone kho jaye ya kisi aur ke haath lag jaye to session foran khatam ki ja sakti hai, jo password ke sath mumkin nahi.

1. Reseller (bahenein jo status par bechti hain)

Login	<code>/login</code>
Naya account	wohi safha — number naya ho to naam aur sheher poochh kar foran ban jata hai
Login ke baad	<code>/dashboard</code>
Cookie	<code>oyebazar_session</code> · 7 din

Reseller ka account **khud-ba-khud chalu** ho jata hai. Bachao aage hai: order us ki apni tasdeeq ke baghair wholesaler tak jata hi nahi.

Andar kya hai: dashboard (kamai, ruke hue order), catalogue + Content Studio (status pack), orders, bazaar.

2. Wholesaler (dukan wale)

Login	<code>/supplier/login</code>
Nayi dukan ki darkhwast	<code>/supplier/join</code>
Login ke baad	<code>/supplier/orders</code>
Cookie	<code>oyebazar_supplier</code> · 7 din

Login **sirf VERIFIED dukan** kar sakti hai. Darkhwast bhejne se dukan live nahi hoti — wo **PENDING** banti hai aur ops team admin portal se manzoori deti hai ya rabta kar ke baqi tafseel mukammal karti hai.

Andar kya hai: aaye hue order (qubool/mana), aur apna maal — stock on/off.

Magic link — bina login

Jab order us ke paas jata hai, WhatsApp par link jata hai:

```
/supplier/o/<token>
```

Ye link **sirf wohi ek order** kholta hai aur login nahi maangta — dukan par jaldi mein yehi kaam ka hai. Token 32 bytes ka hai, ek hi order par chalta hai, aur us safhe par reseller ka retail rate kabhi nahi dikhta (sirf wholesaler ki apni raqam).

3. Admin / super admin (ops team)

Login	/admin/login
Login ke baad	/admin
Cookie	oyebazar_admin · 24 ghante (baqi 7 din)

Session chhoti hai kyunke is portal se poora karobar chalta hai.

Chaar darjay

Barhte hue — upar wale ke paas neeche walon ka sab kuch hota hai.

Role	Kis ke liye	Kya kar sakta hai
REVIEWER	Auditor, investor, naya banda	Sab kuch dekhna — order, maal, resellers, paisa. Badalna kuch nahi.
COORDINATOR	Rozana chalane wala	Us ke ilawa: order aage barhana (wholesaler ko bhejna, dispatched/delivered/RTO)
MANAGER	Team lead	Us ke ilawa: dukan verify/list/band, maal LIVE/archive, reseller band, invoice "paid"
SUPER_ADMIN	Malik	Us ke ilawa: fee rate , invoice banana , aur team (naye user, role, access)

Fee rate aur invoice SUPER_ADMIN tak mehdoon hain kyunke dono seedha kamai ka faisla hain: ek ghalat click se supplier hamesha ke liye 0% par chala jata hai, aur invoice banate hi ledger ki rows **PENDING** se **INVOICED** ho jati hain aur wapas nahi hoti.

Naya user by default **REVIEWER** banta hai — sab se kam ikhtiyar. Barhana aasan hai; "pehle sab kuch de do, baad mein kam kar denge" kabhi yaad nahi rehta.

- Roles aur har ikhtiyar ek hi file mein likhe hain: `packages/core/src/domain/ops-permissions.ts` . Service wahin se rokti hai aur Team ka safha wahin se jadwal banata hai — do jagah likhne ka anjaam yehi hota hai ke UI kuch aur kehti hai aur server kuch aur karta hai.
- Ye rok **service mein** hai, UI par nahi — button chhupana kaafi nahi hota, koi bhi seedha API call kar sakta hai.

Screens

`/admin` dashboard · `/admin/orders` · `/admin/suppliers` · `/admin/products` · `/admin/resellers` · `/admin/money` · `/admin/team`

Naya ops user kaise bane

`/admin/team` se — sirf SUPER_ADMIN. Naam, email, WhatsApp number aur role daal den; login usi number se hoga (koi password nahi). Usi safhe par role badalna aur access band/chalu karna bhi hai, aur ek jadwal jo batati hai ke har role kya kar sakta hai.

Kisi ke jane par **Disable** — us ki saari sessions usi waqt khatam ho jati hain, agle din tak khula hua browser nahi chalta.

- Do cheezen jaan boojh kar roki gayi hain: **apna role khud badalna** aur ****khud ko band karna****. Wajah amli hai — aakhri SUPER_ADMIN khud ko gira de to fee rate aur invoice ka darwaza hamesha ke liye band ho jata hai, aur koi bacha hi nahi jo usay wapas khole.

4. Dev machine par test accounts

Ye sirf local seed ke hain. Production par ye numbers mojood nahi.

Ops

Naam	Number	Role
Ghulam Rasool	03004445566	SUPER_ADMIN
Ops Coordinator	03004445577	COORDINATOR
Auditor Sahib	03005556677	REVIEWER

Reseller

Naam	Number
صادیہ	03001234567
عائشہ	03009876543

Naam	Number
حرا	03331112233

Wholesaler

Dukan	Number
المدينه فيبركس	03001200000
نور ٹيڪسٹائل	03001200010
فيصل فيبركس	03001200040

Dev par OTP kahan se milta hai

Do jagah, dono se kaam chal jata hai:

1. **Safhe par hi** — dev mein code login screen par ek kaale dabbe mein dikhta hai aur khana pehle se bhara hota hai. Production mein ye kabhi nahi aata (do taale: `NODE_ENV` aur messaging provider — dekhien `apps/web/__tests__/security/dev-otp.test.ts`).
2. **Terminal mein** — dev server ke log mein `whatsapp_template_dev` line.

Status pack dev mein render karne ke liye

Dev mein Redis nahi hota, is liye render queue sirf log likhti hai aur Content Studio mein "ban raha hai..." ruka rehta hai. Ek dafa chala kar chhor den:

```
pnpm --filter @oyebazar/worker render:watch
```

5. Teen alag cookies — kyun

`oyebazar_session` (reseller) · `oyebazar_supplier` (wholesaler) · `oyebazar_admin` (ops)

Ek hi naam hota to ek login doosre ko gira deta. Ye rozana hota: dukan par ek hi computer se beta reseller ka kaam bhi karta hai, aur ops ka banda support ke liye reseller ka account bhi khol kar dekhta hai.

Hifazat sirf naam par nahi hai — har session par likha hota hai ke wo **kis** ki hai (`resellerId` / `supplierId` / `opsUserId`). Reseller ka asli token admin cookie mein chipka dein to bhi andar nahi jaya ja sakta; jaancha gaya hai.

6. Secrets kahan hain

● Is document mein koi asli password ya key nahi hai, aur nahi honi chahiye. Yahan sirf ye likha hai ke kaunsi cheez kahan rakhi jati hai.

Local machine	<code>.env</code> (git se bahar — <code>.gitignore</code> mein hai)
Naya developer	<code>.env.example</code> copy kar ke <code>.env</code> banaye
Production (Fly.io)	<code>fly secrets set KEY=value</code> — kabhi repo mein nahi

Kya kya set hota hai:

Key	Kis liye
<code>DATABASE_URL</code> / <code>DIRECT_URL</code>	Postgres (Neon ya local)
<code>APP_URL</code>	Magic link isi se banta hai — production par <code>https://oyebazar.com</code>
<code>WHATSAPP_PROVIDER</code>	<code>console</code> (dev) ya <code>wati</code> (asli)
<code>WATI_API_URL</code> / <code>WATI_API_KEY</code>	WhatsApp bhejne ke liye — OTP aur order ke paighaam
<code>SUPABASE_URL</code> / <code>SUPABASE_SERVICE_KEY</code> / <code>SUPABASE_BUCKET</code>	Status pack ki tasveerein
<code>REDIS_URL</code>	Render queue (na ho to dev mein sirf log)
<code>OPS_API_KEY</code>	Purane <code>/api/v1/ops/*</code> endpoints — naya admin portal is se nahi chalta
<code>DEFAULT_FEE_RATE_BPS</code>	Nayi dukan ka default fee rate (500 = 5%)
<code>RENDER_CONCURRENCY</code>	Worker ek waqt mein kitne pack banaye

`NODE_ENV` yahan **set na karen** — Next/Node khud karte hain. `.env` mein reh jaye to production build tootti hai aur session cookie `secure` nahi rehti.

7. Local par sab kuch chalane ke liye

Teen cheezen, teen terminal:

```
pnpm db:local      # Postgres (embedded, port 5433)
pnpm dev           # website — http://localhost:3000
pnpm --filter @oyebazar/worker render:watch # status pack banata hai
```

Pehli dafa:

```
pnpm install  
pnpm db:migrate:deploy  
pnpm db:seed
```

Seed ke baad upar wale (\$4) saare test accounts kaam karne lag jate hain.
